DETAILED ACTION

1. This Office Action is responsive to the Amendment filed on 2/4/08. Accordingly, claims 1-28 are currently pending.

REASONS FOR ALLOWANCE

2. Claims 1-28 are allowed.
3. The following is an examiner's statement of reasons for allowance:

-Regarding independent claim 1, none of prior art of record teaches or suggests a method for locating a synchronization signal of a next frame in a digital encoded signal, the digital encoded signal comprising a plurality of frames, each frame comprising the synchronization signal, the method comprising procedures of (a) determining a search region from the predetermined search regions defined in a lookup table according to the digital encoded signal; and (b) locating the synchronization signal of the next frame in the search region in the digital encoded signal.

-Regarding independent claim 9, none of prior art of record teaches or suggests an apparatus for searching a synchronization signal of a next frame in a digital encoded signal, the digital encoded signal comprising a plurality of frames, each frame comprising the synchronization signal, the apparatus comprising: a searching module for determining a search region used to search the synchronization signal of the next frame according to the digital encoded signal and a lookup table having a plurality of predetermined search regions and for determining, in the search region, the position of the synchronization signal of the next frame.

-Regarding independent claim 18, none of prior art of record teaches or suggests a method for decoding a digital encoded signal having frames each comprising a header, the header includes a synchronization signal, an index signal, and a frame-length indication signal, the frame-length indication signal indicates whether a current frame has a first length or a second length different from the first length, the method comprising procedures of: (a) receiving the bit-rate signal and the sampling-rate signal; (b) determining a search range from the predetermined search regions defined in the lookup table according to the bit-rate signal and the sampling-rate signal; and (c) locating the synchronization signal of a next frame by backward-searching a predetermined data pattern in the search region.

-Regarding independent claim 23, none of prior art of record teaches or suggests a method for determining a frame length of a current frame in the process of decoding digital encoded signal, the digital encoded signal include frames each comprising a header, the header includes a synchronization signal, an index signal, and a frame-length indication signal, the frame-length indication signal indicates whether a current frame has a first length or a second length different from the first length, the method comprising procedures of (a) determining a search range from the predetermined search regions defined in a lookup table according to the index signal by referring to the lookup table; (b) locating the synchronization signal of a next frame by searching a predetermined data pattern in the search region; and (d) comparing a position of the synchronization signal of the next frame with a position of the synchronization signal of the current frame to determine whether the current frame has the first length or the second length without the need of referring to the frame-length indication signal.
